PLeak 재현 실험 결과 보

Introduction

Can we show similar results
when we did a reproduction experiment?

Reproduction Target

1. Can we show similar results when we did a reproduction experiment?

2. What conditions must be met to produce high performance results?

3. What is the difference from the results of the paper, and why?

Reproduction Environment

/	PLeak Paper	Testing	Reproduction
Environment	A100 x 4	M5 pro / 24GB RAM	4070ti / 12GB VRAM / 64GB RAM
LLM Model	LLaMA-2-7B	OPT-125M	LLaMA-2-7B
AQ Length	12	4	6
D_shadow Size	16	2	2

Testing Process

1. Find the right optimal value for your execution environment
   - use only CPU(MPS not compatible), 32bit
   - LLaMA-2-7B -> OPT-125M
2. Check running environment configuration and code errors
   - python library version & dependency check
   - variable name typo correction and output folder generation logic missing

Reproduction Process

1. HyperParameter Tuning

	Quick Results	Result of the Compromise	Compromise and High Results
AQ Length	6	10	10
D_shadow Size	2	2	8

2. 4 bit Quantization

4-bit quantization using bitsandbytes library

Reproduction Process

Step 1. Initialization

Step 2. Top-K Search , Gradient Calculation & Loss Drop

Summary

/	PLeak Paper	Testing	Reproduction
SM	0.927	0.739	0.493
EM	0.927	0.739	0.492
EED	> 0	0.2	0.175
SS	0.9	0.78	0.88

Conclusion

1. opt model has a high attack success rate, but the trigger is awkward and unnatural

2. While the success rate is low when attacking the llama model,
the context generates natural triggers and exquisitely pulls out prompts without trash text

3. As the target model is more sophisticated,
PLeak attacks also appear to evolve into a much more natural form to bypass the system
